

ABSTRACT OF THE DISCLOSURE

An image capturing apparatus, such as a digital camera, having a movable lens barrier or cover which can easily be opened
5 and closed to operate the image capturing apparatus in various predetermined modes depending on the position of the lens barrier. In one preferred embodiment, the image capturing apparatus has a body having a front face, a back face and a side face, which is between the front face and back face. A lens section is provided
10 on the body and is operable to form an image. A lens barrier is operable to cover the front face, back face and side face of the body and to pivotally move around an axis which is substantially parallel to an optical axis of the lens section.
